IDC Revit House

By Conner Glover

Design Brief/Brainstorming

For this assignment, we were tasked to design and model a house in Revit and then decorate it with the software of your choice.

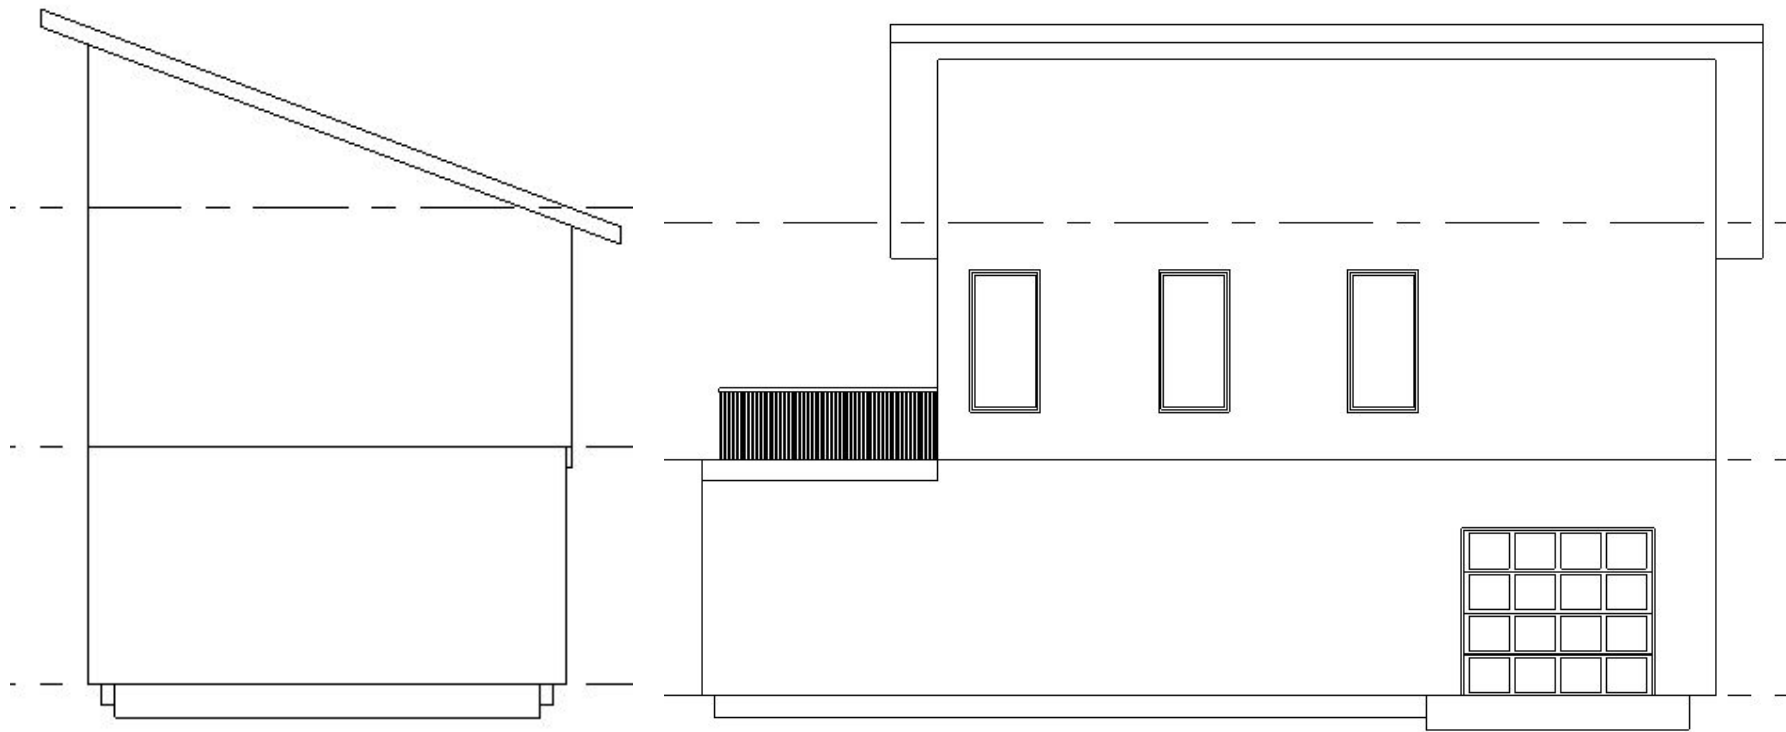

My idea for the house was inspired by the townhomes of the development *The Sanctuary at Lake Zurich*. I was impressed with the price they were willing to pay for such a small house, and it made me realize that the design and the location matter more than the property and the space to the homeowners. I would like to attract buyers willing to purchase a house that is cheaper to produce for \$750,000. For this reason, I set out to create a more downsized version of The Sanctuary's townhomes.

I also wanted to focus on efficiency for maintenance and, originally, placed the bathroom and laundry room directly above the kitchen so all water flowed in the same area, but after accounting for a garage, I understood that I would have to redo my design to maintain this quality.

Inside

Right / Wrong / Learned

- Right

- Used an inspiration for the design and had direction from the beginning.
- Furnished and built the house 100% in Revit, increasing efficiency.
- Used innovative features to make creation more simple and easy.

- Wrong

- Garage added in retrospect and kind of awkwardly.
- The house isn't very expandable.
- Submitted very late.

- Learned

- Direction helps to build a better home.
- Think of elements like a garage and expandability before you start.
