Description

A dome is a rounded, vaulted, or hollow hemispherical forming the roof of a building or structure, typically with a circular base. Structurally, it functions as a 3D arch, distributing weight and pressure across a curved surface to the supports below.

History

The history of the dome is very long, dating back to 19,000 BCE with Mammoth Bone Huts in modern day Ukraine. But it wasn't until 100 BCE that the Romans developed the dome into a more modern form we know today as seen in The Pantheon. In 500, the Byzantine would put a dome on a square base, as seen in the Hagia Sophia. During the Renaissance, Today, domes are still prevalent as seen in Spaceship Earth in Epcot.
