

BEAM BUILDER

v3.2.5

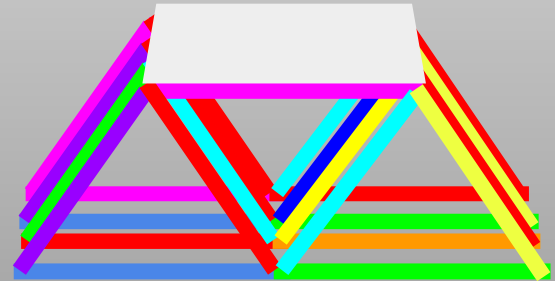

Brainstorming Process

We quickly formed a very specific idea. We would have 4 trusses with our piece of paper attached to the shorter, top end of the paper. Our main oversight was the amount of straw required and how we were going to attach the trusses so they don't flex side to side.

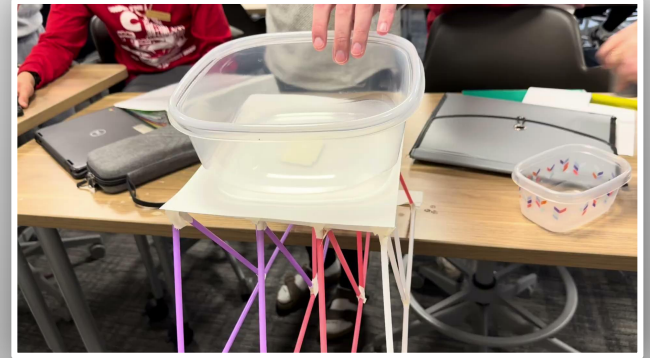

=

Results

For this project, our oversight lead to our inevitable failure. The lack of any lateral support killed us in the end.

RIGHT	WRONG	LEARNED
● We approached the project with a good plan and executed upon it. ● We tried to think outside of the box by using a hot glue gun.	● I (Conner) was very cocky about our design. ● We traded away a lot of tape for a few straws which ended up killing us in the end when we ran out of straws. ● We forgot to account for the lateral buckling that the design was prone to. ● Presentation was late	● Don't be cocky. ● Account for the side to side flexion. ● Don't trade things until you know what you're gonna do
