

Water Transport Instant Design Challenge

Joey Lodowsky, Johnny Collins & Connor Glover

THE CHALLENGE

Given 8 pieces of cut up PVC pipe, 6 pieces of styrofoam, and unlimited tape we were tasked with creating a water transportation system. Groups were split into triples and were competing on who can make the most efficient system.

THE VISION

We attempted to go with the good old fashion **aqueduct** model. Using our PVC pipe and ALOT of tape we made a suitable half-pipe, with some added styrofoam, to escort the water; this was made possible by the downforce of gravity on our decreasingly sloped tables.

THE VIDEO

THE RESULT

A.P. S.C./N.L. / J.D.

$$\frac{279}{326} \cdot 235'' = \underline{\underline{201}}$$

J.C./C.G. / J.L.

$$\frac{327}{339} \cdot 262 = 253$$

10 Losers

We won
because we
are goated

Right

- We came in with a defined goal, understanding the requirements and constraints.
- We took inspiration from other groups after seeing interesting ideas.
- We thought outside the box, using classroom elements that had no explicit regulation according to the rules.
- We won.

Wrong

- We used possibly the worst strategy to attach the PVC pipes, but it worked so who cares.
- We used multiple rolls of tape, thinning out Mr. T's restricted resources.
- We had to adjust the pins on three tables.
- Many elements weren't plan and created last minutes without consultation of group members.

Learned

- Communication is key
- Come in with a good strategy
- Don't be afraid to fail or change your idea because that's what leads to growth.
