Design Principles and Elements - Analysis
Civil Engineering and Architecture DC
By S. Vortherms, C. Glover

Description

We were tasked with taking photos, in the Carmel garden, of different design components—components known to improve any environment and design. The components consist of lines, color, space, texture, value, and form of shape.

This image reveals contrasts and displays symmetry.

This image reveals different types of lines and shapes, as well as the symmetry of the cross designs. Furthermore, there is a common brick texture present throughout the garden

This image displays a variety of colors and also hides many unappealing elements on the walls. There is curvature added to balance out the design constraints from the previously formal environment.

These images show many different textures and materials incorporated with nature and spacing to enhance comfort. There is a lot of curvature incorporated throughout the garden which is very evident here.

This image balances out the colors, and also displays contrast and curvature.

This provides a versatile, welcoming area to the garden as well as utilizing different textures and curvature to create unity.

These tiles have multiple different lines and shapes.

This waterfall provides a centerpiece to the garden by adding movement and contrast, as well as being symmetrical and giving a contrast of color.

This displays how well lighting was disguised in the garden that becomes important at night to keep the utility of the area.

This fire pit provides the garden with some proportion to scale, some rhythm, and some contrast.
