

1.1.4 Product Improvement - Coffee cup

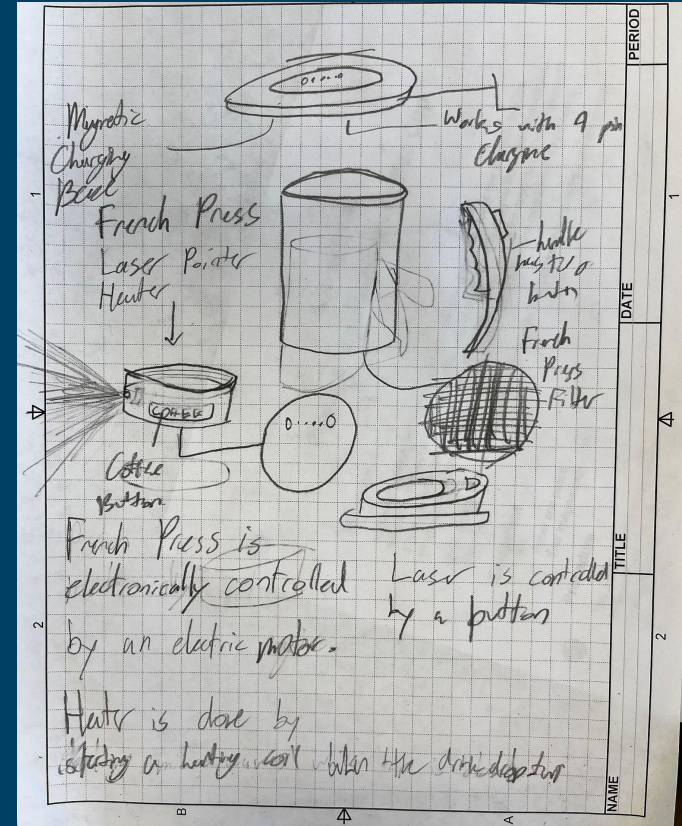

With Camden Everett & Conner Glover

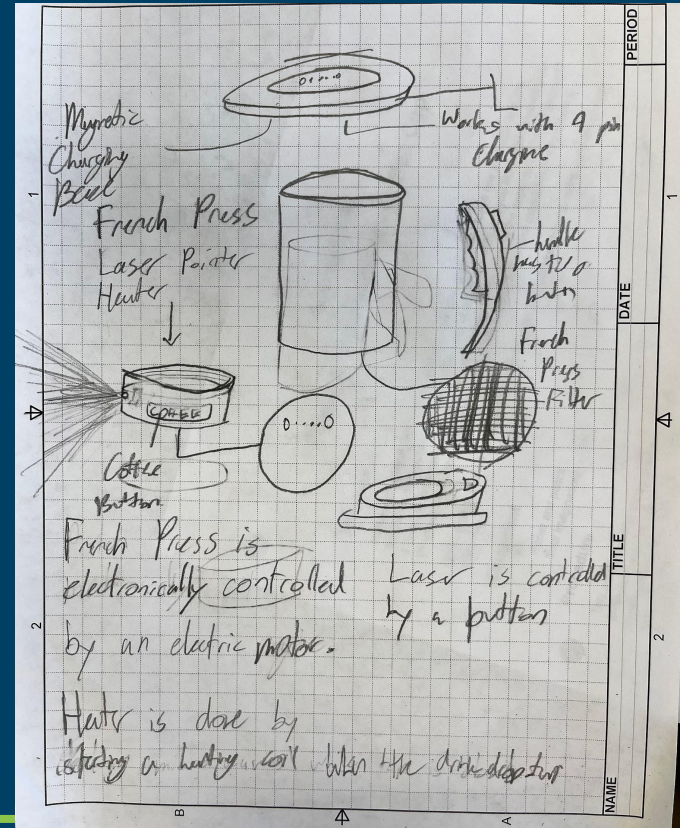

Our thought process.

When we were thinking about what we would make a coffee cup that could sorta be used as a jack of all trades. We thought about what we could eliminate in the coffee making process. So we thought of a few ideas and eventually arrived on this concept. [cue next slide]

We thought of a design by adding a small burner in the bottom of our mug to heat the coffee to a controlled temperature. We were also thinking about adding a laser pointer/flashlight for teachers to annoy students

Out Final Design. Our final design is a coffee mug that has a handle with a grip design and a button. When you grip the handle the top opens. The button triggers the laser and locks input on the grip as to not spill anything. The mug part has a filter at the bottom which connects to the bottom part which can be used as a french press after being heated. The french press is controlled by an electric motor. You can charge by putting it on a base/coaster with a 4 pin charger.

R/W/L

Right, wrong, learned.

- Right: We thought of a 2-part coffee cup. The bottom part has a lot of features and it work well.
 - Wrong: We thought that we should use microwaves to heat the coffee. But, a magnetron is way too big to go into the base.
 - Learned: We learned how to use our creativity to improve something. And how to work in a team and discuss ideas.
-
