

2.1.5 Calculating Moments

By Ryan, Conner & Angelo

Process

We had to calculate the moment of a board and some weights by having someone hold the board and acting as a fixed support with 500g weights on the opposite end of said board. There were three different varying lengths of board. Our high score was 22 seconds on the 90 centimeter board.

Math

Board #1: $M=(9.8)(30\text{cm}) = 0.294$ Newton meters

Board #2: $M=(9.8)(60\text{cm}) = 0.588$ Newton meters

Board #3 $M=(9.8)(90\text{cm}) = 0.882$ Newton meters

• WE TRIED HARD • WE HELD THE BOARDS • WE MEASURED IN METRIC	• NEARLY BROKE CONNER'S PHONE • DROPPED THE WEIGHT ANYWHERE FROM 4 TO 8 THOUSAND TIMES	• DON'T DROPS WEIGHTS. • DON'T LEAVE YOUR PHONE UNDER WEIGHTS.
