

Maze Car

By Quinn Emmons and
Conner Glover

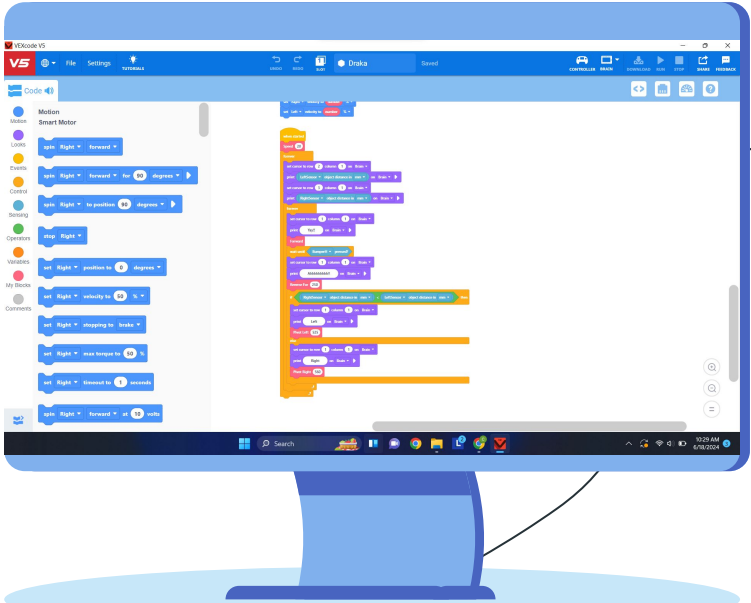

The Project

We had to code a closed loop robot that made its way through a maze.

Our Code

Here is a screenshot of our code from the maze car project.

Process for Code Design

1

Drivetrain

Create our own drive train using functions.

3

Creation

Code the concept we found most suitable.

2

Concept

Evaluate different concepts that could work.

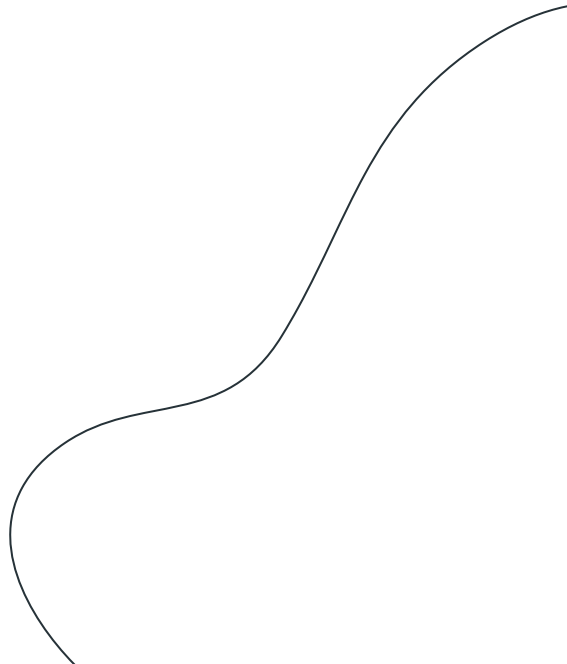

4

Trial and Error

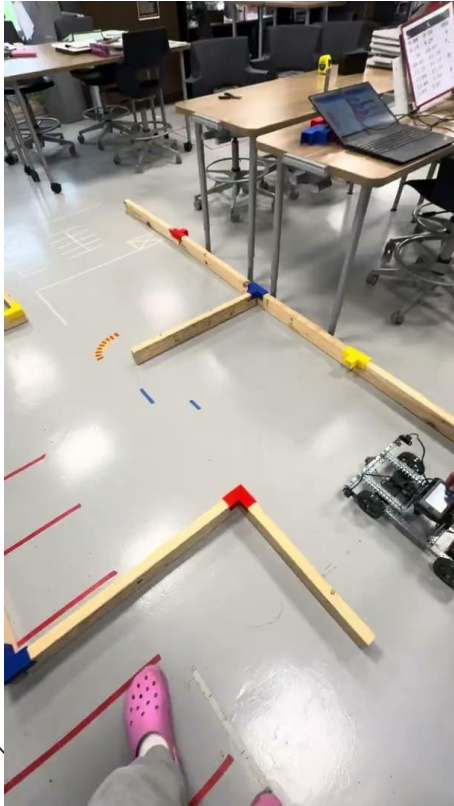

Test our code and find errors, solving them along the way.

Problems we encountered.

Our only problem was getting the car calibrated. We had to tweak how far it moved forward and backwards and how much it turned.

Media

R/W/L

1

Right

Completed our code rather quickly in under 30 minutes, while making sure it was completely functional.

2

Wrong

Pretty much nothing, except for a little arrogance.

3

Learned

The simplest solutions is usually the best.
